COL351: Analysis and Design of Algorithms

Fall 2024

Tutorial Sheet 2

Announced on: Aug 01 (Thurs)

Problems marked with (\star) will not be asked in the tutorial quiz.

1. Consider the following algorithm for checking whether a given number n is prime.

Prove or disprove:

- a) The algorithm is correct.
- b) The algorithm runs in polynomial time.
- 2. Consider the following algorithm for calculating a^b where a and b are positive integers.

Suppose each multiplication and division operation can be performed in constant time. Determine the asymptotic running time of FastPower as a function of b.

3. Let *A* and *B* be two sorted arrays of length *n* each. Assume that all elements within and across the two arrays are distinct. Design an $\mathcal{O}(\log n)$ algorithm to compute the n^{th} smallest

Tutorial Sheet 2:

element of the union of A and B.

- 4. Design an $O(\log^2 n)$ algorithm that, given a positive integer n, determines whether n is of the form a^b for some positive integers a and b > 1.
- 5. You are given a sorted (from smallest to largest) array A of n distinct integers which can be positive, negative, or zero. You want to decide whether or not there is an index i such that A[i] = i. Design the fastest algorithm you can for solving this problem.
- 6. (*) You are given an *n*-by-*n* grid of distinct numbers. A number is a *local minimum* if it is smaller than all its neighbors. A *neighbor* of a number is one immediately above, below, to the left, or to the right. Most numbers have four neighbors; numbers on the side have three; the four corners have two.
 - (a) Prove that a local minimum always exists.
 - (b) Use the divide-and-conquer algorithm design paradigm to compute a local minimum with only $\mathcal{O}(n)$ comparisons between pairs of numbers. (Note: since there are n^2 numbers in the input, you cannot afford to look at all of them.)
- 7. (*) You are given a sequence of n numbers a_1, a_2, \ldots, a_n . Design an $\mathcal{O}(n)$ algorithm to find i, j with $i \leq j$ such that the sum $a_i + a_{i+1} + \cdots + a_j$ is maximum. Note that the numbers may not be positive.
